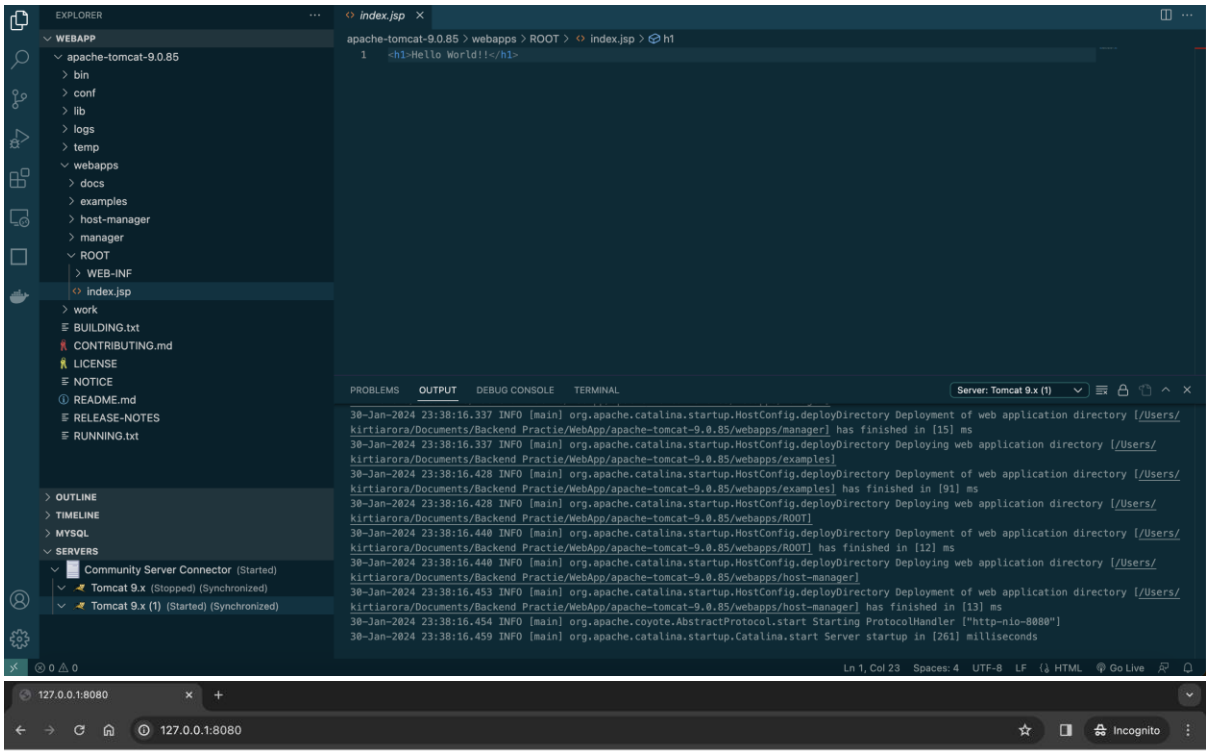
How can we create Dynamic Web page in VS Code??

Running a server in Visual Studio code can be possible via "**Community Server Connectors**" it's an extension or plugin in VSCode in order to connect a server within the editor like various other robust IDE .

Various other robust IDE support running a server like Apache Tomcat directly from within the development environment. Here are some notable IDEs with this capability.

- **Eclipse:**
    - Eclipse is a popular open-source IDE known for its extensive plugin ecosystem and support for various programming languages and frameworks.
    - It offers the Eclipse Enterprise for Java (EE4J) edition, which includes features for Java Enterprise Edition (Java EE) development and supports running servers like Apache Tomcat, Jetty, and GlassFish.
    - Eclipse provides tools for configuring server runtimes, deploying web applications, and managing server instances directly from the IDE.
- **IntelliJ IDEA:**
    - IntelliJ IDEA is a robust IDE developed by JetBrains, known for its powerful features and user-friendly interface.
    - It offers seamless integration with servers like Apache Tomcat, Jetty, and JBoss, allowing developers to run, debug, and manage server instances from within the IDE.
    - IntelliJ IDEA provides built-in tools for configuring server runtimes, deploying web applications, and monitoring server logs.
- **NetBeans:**
    - NetBeans is an open-source IDE that provides comprehensive support for Java development, including Java EE development.
    - It offers features for running servers like Apache Tomcat, GlassFish, and Payara directly from the IDE.
    - NetBeans includes tools for configuring server runtimes, deploying web applications, and managing server instances as part of its Java EE development support.
- **Visual Studio Code (VS Code) with Extensions:**
    - While Visual Studio Code is primarily a lightweight code editor, it can be extended with plugins and extensions to support running servers like Apache Tomcat.
    - Extensions like "Tomcat for Java" or "Tomcat Server" available in the Visual Studio Code Marketplace enable developers to launch and manage Tomcat servers directly from the editor.
    - These extensions provide features for configuring server settings, deploying web applications, and monitoring server activity within VS Code.


These IDEs offer developers a convenient and efficient way to develop, test, and debug web applications by providing seamless integration with servers like Apache Tomcat. The choice of IDE depends on factors such as personal preference, project requirements, and language support.
